ABSTRACT

- The multi-category event booking landscape is currently fragmented, forcing users to rely on multiple platforms to find and book different activities like concerts, sports, workshops, and comedy shows.
- This UI/UX study presents the end-to-end design of a unified event platform built in Figma that simplifies discovery, decision-making, and purchasing into a single, intuitive application.
- Using a User-Centered Design (UCD) process—including user research, competitor analysis, personas, user flows, wireframing, high-fidelity UI design, and usability testing—the project focuses on reducing user friction throughout the booking journey.
- Key features include an advanced search and filtering engine, dynamic seat selection, direct digital ticketing, and an integrated AI assistant chatbot designed to offer real-time customer support and personalized recommendations.
- The primary output is a fully interactive Figma prototype and design system engineered to make event discovery fast, convenient, and engaging.

INTRODUCTION

- In the modern digital landscape, the entertainment and leisure industry offers an unprecedented variety of live experiences, ranging from high-energy music festivals and professional sports games to intimate workshops and stand-up comedy shows.
- However, the digital infrastructure supporting event discovery remains highly fragmented.
- Currently, users are forced to navigate multiple specialized platforms, each with distinct interfaces, registration processes, and checkout flows, simply to organize their leisure activities.
- This disjointed ecosystem introduces severe friction into the user journey, creating high cognitive load and decision fatigue.
- Thus, the goal is to design a centralized, all-in-out multi-category event booking application in Figma that unifies discovery, ticket selection, and checkout into a seamless experience.
- The platform will incorporate an integrated Al assistant chatbot to provide real-time support and tailored recommendations, ultimately reducing time-to-booking and maximizing user satisfaction.

OBJECTIVE

* Centralize Event Discovery: Unify multiple event categories (concerts, workshops, sports, comedy) into a single platform to eliminate app-switching and reduce user friction.

* Streamline Search & Filtering: Implement advanced multi-parameter search capabilities (date, venue, category, price) so users can find events in minimal clicks.

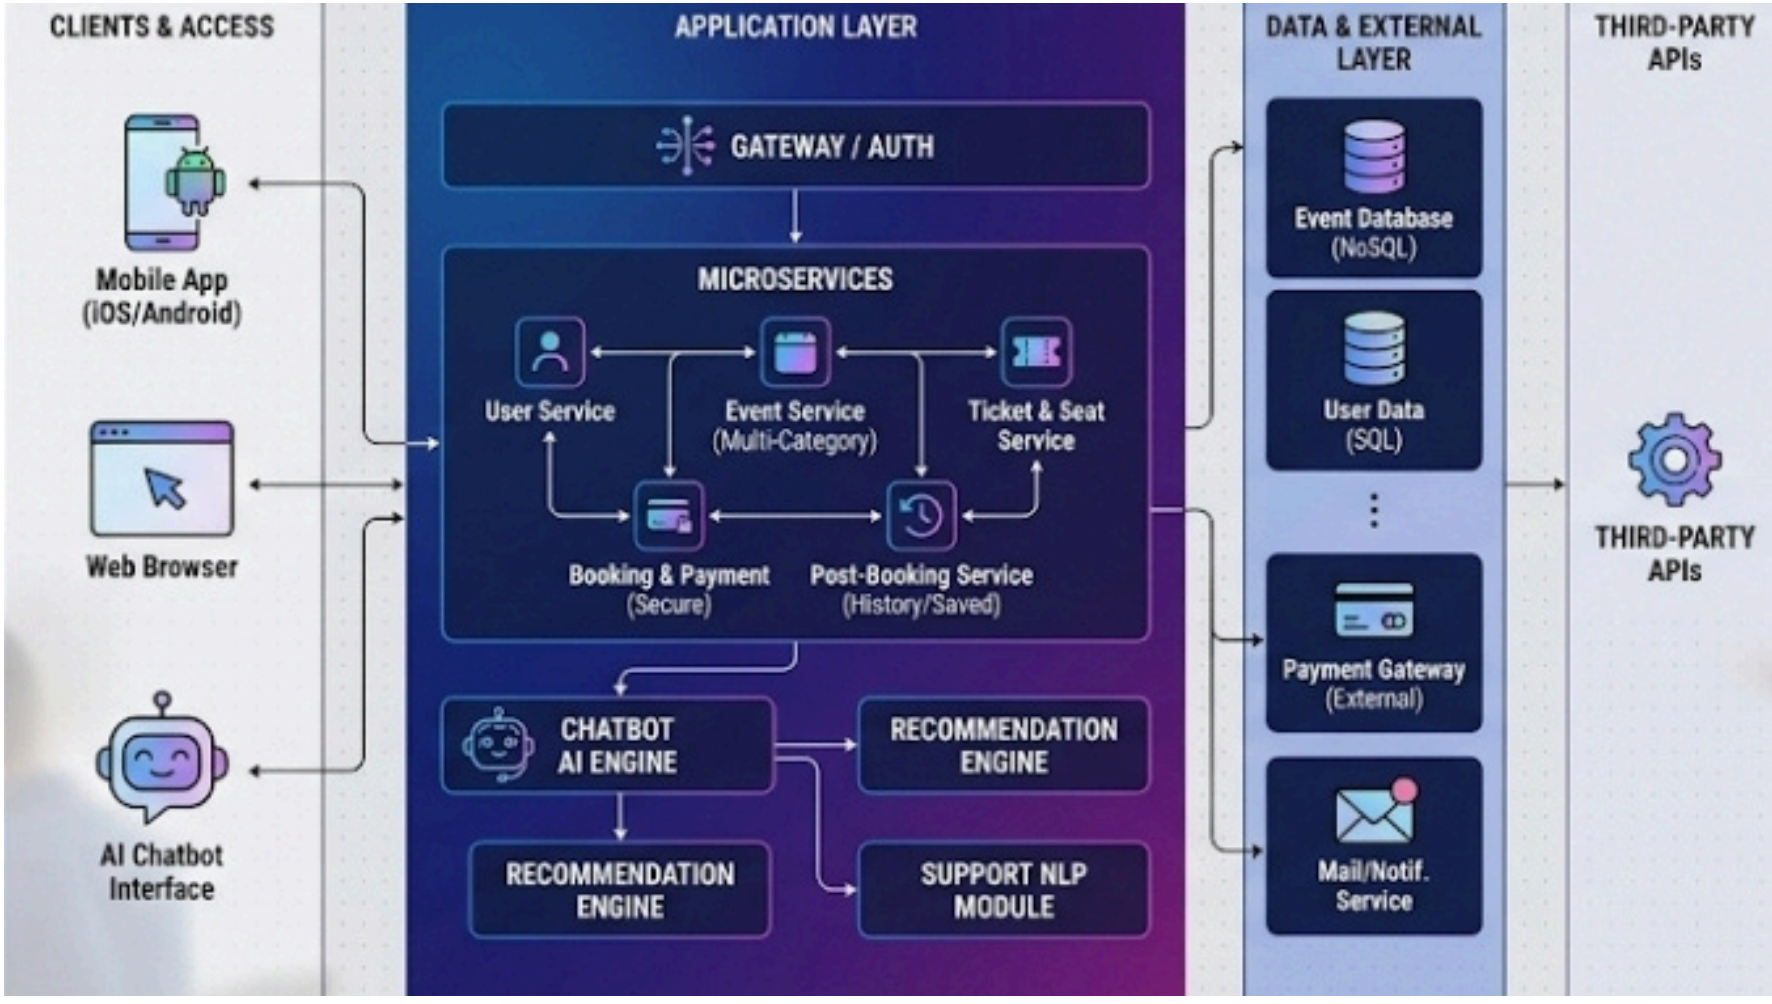

* Optimize Ticket Selection & Checkout: Design an intuitive, minimal-step purchasing flow featuring clear seat selection maps and transparent fee structures.

* Integrate Real-Time Assistance: Embed an AI chatbot directly into the app flow to offer personalized recommendations, answer event FAQs, and assist during checkout.

* Enhance Post-Booking Experience: Provide effortless ticket management through centralized digital tickets, saved events, and purchase history.

* Validate via UX Methodology: Apply an iterative design process in Figma—from wireframing to high-fidelity prototyping and usability testing—to ensure low task-completion times and high user satisfaction.

IDEATION MAP

MODULE IMPLEMENTATION

- Auth & Profile: Login/signup options (email, Google, Apple), user profile, and preference settings.
- Discovery & Search: Multi-category bar (Concerts, Sports, Workshops, Comedy) with date, location, and price filters.
- Details & Ticketing: Event info view with line-ups, schedules, and dynamic seat/ticket selection.
- Checkout & Payment: Minimal-step order summary, fee breakdown, and secure payment processing.
- Digital Tickets: Post-booking QR-coded passes, calendar sync, and booking history storage.
- AI Chatbot Support: Floating AI assistant for instant event recommendations, FAQs, and checkout help.

CONCLUSION

- This UI/UX project successfully presents a streamlined, end-to-end design solution for a multi-category event discovery and booking platform built in Figma.
- By consolidating diverse event types—such as concerts, workshops, sports, and comedy shows—into a single, intuitive application, the proposed design effectively eliminates platform fragmentation and reduces cognitive load for users.
- Incorporating an integrated AI chatbot provides immediate support and personalized recommendations, bridging the gap between automated assistance and user convenience.
- Ultimately, this user-centered design approach optimizes the event journey from discovery to digital ticket management, establishing a seamless, fast, and engaging experience for modern event-goers.
